Assignment 7

Introduction

This document is intended to provide an overview and explain:

1. When to use a SQL UDF.
2. The differences between Scalar, Inline, and Multi-Statement Functions.

Topic 1: When to use a SQL UDF.

A SQL UDF is used when SQL doesn't have an already defined/built-in function that is needed, especially when the same code is needed to be written over and over again in order to accomplish when is needed. Overall, it is used to avoid repetition.

Topic 2: The differences between Scalar, Inline, and Multi-Statement Functions.

Scalar Functions allow you to bring back a single function.

Inline Functions allow you to bring back a table.

Multi-Statement Functions allows you to bring back a table, but requires more flexibility as it requires multiple steps to create the table.

Summary

This document generally outlines the superficial use of SQL UDFs and the differences between Scalar, Inline, and Multi-Statement Functions.
